

SOVR Development Holdings, LLC

Strategic Legal Wrapper for the SOVR Digital Ecosystem

Comprehensive Business Structure, Issuing Partner Pitch, and System Protocol for Virtual Card Integration.

EXECUTIVE SUMMARY

SOVR Development Holdings LLC operates a programmable, trust-backed financial protocol enabling blockchain-verified payments to be converted into real-world purchasing power through virtual card issuance partners. The system is fully pre-funded, risk-minimized, and structured under a compliant trust and LLC architecture designed for enterprise-level scaling and vendor interoperability.

This document outlines the system architecture, company structure, regulatory positioning, the technical protocol, integration expectations, risk model, and partnership request for card issuers.

COMPANY STRUCTURE

Legal Entity: SOVR Development Holdings LLC

Parent Structure: Trust-Backed Governance + Operating LLC

Purpose: Operate digital asset settlement layer, real-world payment primitives, and programmable value infrastructure.

Divisions:

1. Protocol Division – Smart contracts, settlement logic, blockchain event layer.
2. Issuing Integration Division – Vendor API orchestration (Stripe, Marqeta, Lithic, etc.).
3. Compliance Division – KYB, AML flagging, KYC partner management, transaction monitoring.
4. Treasury & Reserves Division – Prefunded accounts, capital flows, risk control, reporting.
5. User Operations Division – Customer support, onboarding flows, card issuance support.

All divisions operate under unified oversight from the trust structure and produce verifiable, auditable logs for financial and regulatory reporting.

SYSTEM OVERVIEW

SOVR integrates on-chain payment validation and off-chain settlement execution through a modular

- bridge called the VirtualCardBridge.
- Users deposit ETH or internal credit units.
- Smart contract validates value & locks funds.
- Event processor listens to blockchain and issues an API-triggered card creation request.

- Virtual card is created with strict controls.
- Issuer returns card details to the processor.
- Processor confirms generation on-chain.
- User receives a spend-ready virtual card.

This creates a deterministic, programmable settlement system where the issuer takes no credit risk.

TECHNICAL PROTOCOL COMPONENTS

1. Smart Contracts (VirtualCardBridge)
 - Nonces for replay protection
 - Prefunded transaction validation
 - ETH and token settlement acceptance
 - Multi-role governance (Admin, Operator, Guardian)
 - Event emissions for card creation triggers
 - Immutable tracking and transparency
2. Off-chain Processor (Node-Level Event Listener)
 - Websocket blockchain listener
 - Signature verification
 - Vendor API integration
 - AML flags and optional KYB/KYC validation
 - Card creation orchestration
3. Issuing Partner Integration
 - Prefunded card creation
 - Spend limit enforcement
 - Category restrictions
 - One-time-use or ongoing authorization controls
 - Direct card tokenization for mobile wallets

RISK MODEL

Risk exposure to issuer: Zero.

- All cards are fully prefunded prior to creation.
- Funds remain locked until issuer confirms card creation.
- No credit extension. No overdraft. No reclaim events.

Compliance:

- All transactions logged on-chain.
 - Every event has cryptographic timestamp, sender, and amount.
 - AML triggers integrated into off-chain logic.
- System embeds deterministic value limits by design

SOVR Development Holdings, LLC

Strategic Legal Wrapper for the SOVR Digital Ecosystem

*Comprehensive Business Structure, Issuing Partner Pitch,
and System Protocol for Virtual Card Integration.*

BENEFITS TO ISSUER

1. Zero Risk Model
All cards are created after value is locked and validated on-chain.
2. High Volume Throughput
Programmable system enables instant creation, reloads, and controlled spending.
3. Immutable Compliance Layer
Blockchain ledger provides perfect audit trail.
4. Revenue Opportunities
 - Card issuance fees
 - Interchange opportunities
 - Program management expansion
 - Value-added services at scale
